Using a Machine Learning Algorithm to Create a Computational Artwork: Variable

Assist. Prof. Dr. Selçuk ARTUT

Abstract

As computational systems have become an integral part of our daily lives, we often see that contemporary art also has adopted itself with the newborn technological changes in diversified dimensions. Machine Learning, which has recently become a remarkable development in science, has also begun to manifest itself in various artistic works. As accordingly, the artwork that has been created by the author of this article named "Variable" stands as an interactive work of art that embraces machine learning algorithms within its compositional structure. The artwork was extensively influenced by the sophisticated discourse of German philosopher Heidegger's book "Being and Time". Consequently, Being and Time text has been taught to a machine learning system, and thus the system has been able to automatically generate new original contents when the viewer interacts with the touch of a button. The generative system performs its Machine Learning Markov Chain operations with the implementation of a Python programming language-based library named Markovify. The work constantly redefines its own artistic title and statement with the use of a machine learning framework. In this article, the contribution of machine learning to the production of artworks is being examined while focusing on various implementations.

Keywords: Machine Learning, Art and Technology, Markov Chain, Algorithmic Art, Code and Art

Introduction

Machine Learning has received a notable amount of attraction in the past few decades. With the introduction of Bayes Theorem, the underpinnings of the concept may refer to the early 19th century, but its framework has been progressively developed and substantial accomplishments have been achieved over the course of couple years. Machine learning aspires to mimic human intelligence while gathering data from previous experience and suits them into a reasonable structure with associated outcomes. Unlike the common sense of computers as being a well-defined deterministic system, machine learning uses the given set of data to interpret statistical reasoning with no explicit design of a deterministic system. Machine learning extensively performs computational methods to calculate statistical operations to come up with accurate models for interpreting explicit results. With the employment of computational statistics, Computer Science has been hosting the science of machine learning to formulate new findings in
various fields of applications. Some of the popular applications of use would be in Bioinformatics, Computer Vision, Economics, Insurance, Search Engine Engineering, Financial Market Analysis etc (Waibel et al 1990, Pomerleau et al 1996, Cooper et al 1997). Correspondingly, Machine learning has a far-reaching potential to be investigated with diversified implications in solving complex problems. As an example, medical scientists have been investigating how to use machine learning for early detection of terminal diseases such as cancer and aids. The researchers imply that the machine learning is helping to improve basic understanding of cancer development and progression (Cruz 2006, Cho 2003). Additionally, various researchers (Schumaker et al 2009, Yoo et al 2005, Patel et al 2015), have been analyzing stock market predictions using machine learning paradigms.

According to Arthur Samuel (1959:32), Machine learning is a field of computer science that gives computers the ability to learn without being explicitly programmed. Géron (2017:4) defines machine learning as the science and the art of programming computers so they can learn from data. Mitchell (1997) defines machine learning as a field that examines how computer programming can be set up so that computers can evolve automatically from experience. To formulate algorithms based on experience, researchers have been using the field of data sciences. Previously symbolic/knowledge-based systems have been accepted as more capable to machine learning systems. However, with the recent abundance of data, more research was studied to generate experience-based systems for getting effective results.

As humans, we frequently address learning to enhance our thinking to harvest knowledge. Nevertheless, humans generally learn things unconsciously and as a result, it becomes quite difficult to simulate the structure of a human intelligence deeply. Due to the increasing demand from related fields of study, researchers in this field are extensively working on
building efficient algorithms to digest statistical data with machine learning structures. However, it is not only the science applications benefitting from implementations of machine learning. Progressively artists are starting to seek how machine learning can be employed in the process of art-making. Consequently, machine learning can be used to drive new and compelling ideas for the arts community as equally as well.

**Related Work**

On the other hand, there is also a growing number of artists who are ambitious to create new forms of art with the use of machine learning. Needless to say, computational systems have become an integral part of our contemporary lives and arts also has been deeply influenced by the recent technological advancements in machine learning. As a composer of interactive electronic music, Laetitia Sonami is best known for her live-performances with the use of an electronic apparatus named Lady’s Glove. Lady’s glove consists of various electronic sensors and actuators that are used to manipulate sound elements located on a connected computer. In the same manner, Sonami later created the Lady’s Glove’s successor the Spring Spyre with a different computational structure. Spring Spyre employs a machine learning tool named Wekinator that is a free, open source software developed by a researcher named Rebecca Fiebrink. According to Fiebrink (2017), Wekinator lets users create new musical systems with data provided by gestural components.
Sonami (2016) defines her experience as a gained flexibility with the fun of exploring exciting results. Previously with the Lady's Glove, her performances have relied on explicit rules defined apriori by the artists’ decisions in building an interactive system. Therefore she needed to apply certain filters to separate various types of gestures from the each other. Later with the addition of machine learning, Sonami was allowed to reverse the decision-making orientation by teaching performative gestures to the system and after recalling them during her live performances.

Similar to Sonami, Gene Kogan is an artist working with programming skills to find cross sections of computer science with arts. Kogan has been working on developing a free educational resource “ml4a” for artists who would want to integrate machine learning into their art projects. In addition to his academic activities, Kogan creates distinctive works of art with extensive machine learning influence. Kogan’s artwork titled Doodle Tunes (2017) enables the users to turn simple hand drawings of musical instruments into computer-based sound sample players.
Cogan implements convolutional neural networks to analyze the hand-drawings with computer vision techniques and classifies them into musical instruments with certain prediction values. In another work titled Neural synthesis (2017), Kogan experiments with a technique called neural synthesis. According to Kogan, neural synthesis manipulates bitmap images with a pixel-based optimization technique to attain some desired level of activations in a convolutional neural network. In his video artwork submitted to an Annual Conference on Neural Information Processing Systems (NIPS, 2017), it is observed that the dream-like hallucinogenic visual content reminds us the similar processing technique that was used in the famous artwork “Deepdream” by Alexander Mordvintsev. Similarly, we are observing a certain kind of a visual abstraction with the use of the neural synthesis technique. In DeepDream example, Mordvintsev et al (2016) have trained an artificial neural network with millions of training data to adjust the system to deliver the desired set of classification schemes. Based on this classification scheme, researchers then require the system to give them a qualitative sense of the level of abstraction which they name “Inceptionism”. As a result, the machine learning enables the researcher to deliver unexpected visual contents within an iterative process.
Likewise, Markov Chains have been implemented in a project called The Mansfield Reporter by Max Lupo (2015). According to Lupo, The Mansfield Reporter is a simple device that creates new texts generated from some of history’s greatest authors like Friedrich Nietzsche, William Shakespeare, or Gertrude Stein etc. Based on the previous corpus of texts, the algorithm uses statistical methods to create similar texts that have a structural resemblance to well-known authors of the past. With a substantial amount of previous data, Markov Chains enable us to stochastically forecast probabilistic models with a reliable outcome.

**Methodology**

Because of the distributed computational necessities required by the art piece, the idea of having a hub of interconnected computers have been pursued to handle the results of the machine learning algorithms. In particular, nine micro-size computers (Raspberry) were interconnected to a local network and the communication traffic was accomplished with the use of a network protocol named Open Sound Control (OSC-Wright 2005). The main computer facilitates Markov Chain operations based on a Python programming language library and generates a new text when a button is triggered by the visitor. Display interfaces and the OSC communication
were programmed in the Processing Development Environment (Reas & Fry 2007).

In order to handle Markov Operations on a corpus of a text, this artwork uses Python Coding environment with implementing Markovify Library. Markovify is a simple Markov chain generator that generates random sentences from a given text. According to Singer-Vine (2017), Markovify works efficiently with considerably large, well-punctuated contents. Consequently, Being and Time text was organized with necessary punctuation structuring that is required by the Markovify Library.

At the front facade of the installation, the structure is built on a facade of a stainless reflective steel with a size of 60 cm (height) to 170 cm (width). Stainless surface serves as a screen for reflecting objects in the circumference and solidifies a minimalist look while hiding all the...
technological complexities hidden at the behind. Moreover, participants would become an integrated entity for the piece while seeing their reflected images on the shiny surface.

Additionally, very thin fluorescent bulbs have been mounted in between the display screens as physical separators with bright white emitting lights. Not only because that the fluorescents are adding a distinctive layer of aesthetics to the piece, installation of the fluorescents enhances the feeling of contrast between the physical substance of the piece and its embedded digital non-materiality. Next to the main structure of the piece, a 5-inch LCD display mounted in a box has been placed to display information about the art piece. When a visitor clicks on the button, with the help of the Machine Learning Algorithm a new title and a statement is regenerated immediately. At the same time, the new title is broken into letters and on each of the display screens placed in front of the art piece, a flowing text animation begins. Generated texts are commonly dominated by ontological questions based on the “being” on a conceptual level, and the words of “being” are string replaced with generated artwork’s titles. As a result, the artistic statement is formed into an ontological text philosophizing on a conceptual artistic title.
based on Heidegger’s philosophical text with Machine taught algorithm interpretations.

**Conclusions**

Inevitably technology has a great impact on shaping the way we perceive art with many intertwined dimensions. Needless to say that it is not an unexpected result since it has always been true for the cases in which we observe the inclusion of technology in the art-making process. Previously it could have been the invention of a new painting technique with the use of an emerging apparatus, today it is just another advancement in the technical implementation and most likely that it is based on concurrent digital technologies. Similarly, when machine learning became available for the artists to investigate, its creative potential has been intensively explored by the group of artists who are excited with the utilization of technology in the art-making process. This study aims to describe the methodologies behind the way in which the artwork “Variable” has been produced. In addition to all the research that has been studied in the field of machine intelligence, this artwork aspires to bring about an opportunity to discuss the notion of authenticity. As a result of the attempt to make art with the use of machine learning techniques, it is observed that we have limited information about human intelligence functions when we consider the boundaries of the creativity taking place in the arts.
